

# The Latest in Open Source Maps

---

**Stephanie May**  
Matthew Whilden

**LinuxFest Northwest 2026**

April 25, 2026 • Bellingham, WA

# Who We Are

## Matthew Whilden

- Board President, OpenStreetMap US
- Compiler developer turned community mapper

*"I come to maps purely from enthusiasm. I've been mapping seriously on OSM for 5 years—previously a software developer now consuming map data to make tools, widgets, and novelties. I love using the map to explore the complexities and oddities of our world."*

## Stephanie May

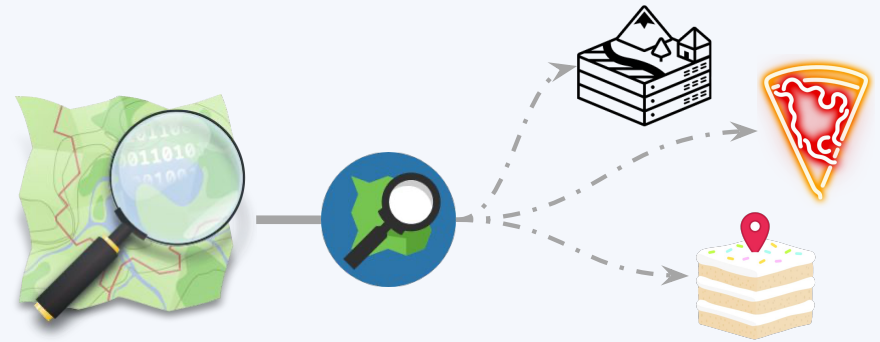

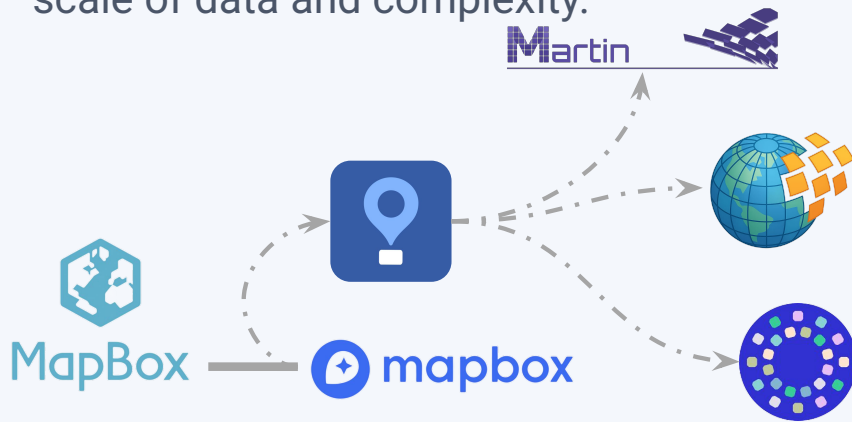

- Governing Board, MapLibre
- Cartographer and educator at the nexus of enterprise and open infrastructure

*"I come from a traditional GIS background, but gravitated toward open source software and cartography. I ended up specializing in web maps at just the moment when the hegemonic forces since Google Maps carved out its niche were starting to give way."*

# Why This Moment Matters

The breakthrough isn't one tool – it's that the ecosystem now has viable open options at every scale of data and complexity.

*Stop me if you've heard this story before: proprietary product changes its license, community forks it, the fork becomes the standard. What changed recently is that the ceiling was lifted at every decision point simultaneously—not one breakthrough tool, but the whole stack maturing together.*

*You may know OpenStreetMap as 'the Wikipedia of Maps,' but increasingly our communities are investing not only in cataloguing what goes in, but also how to ease the process of building with and displaying what comes out. There's a virtuous cycle: folks get excited about a map, they add more data, the maps get better, the maps get more exciting!*

# What Just Happened: OSM US

## OSM US Tileservice

[GA since September 2025](#)

- Free for low-volume, non-commercial use — no account, no API key
- Provides vector tilesets, raster hillshade, and fonts
- Already powering Americana, OpenTrailMap, OSMCha, SliceOSM
- Partner Tier for commercial/high-volume (donation-based, not metered)
- Entire stack is fully open source on GitHub

## Layercake

[data.openstreetmap.us](https://data.openstreetmap.us)

- OSM as thematic GeoParquet layers—query with DuckDB, open in QGIS
- No database or tile pipeline required—a fundamentally new way to work with OSM data

## SliceOSM

[slice.openstreetmap.us](https://slice.openstreetmap.us)

Custom PBF extracts by arbitrary bounding box — more flexible than predefined regions.

# What Just Happened: MapLibre

## OSMF migrating osm.org to MapLibre

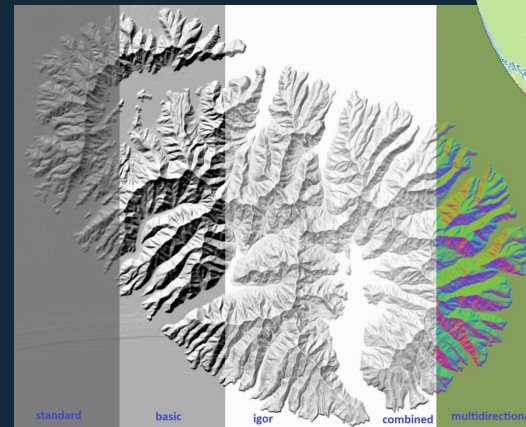

- OSMF deployed its own vector tiles (July 2025)
- Full migration to MapLibre GL JS in progress

## MapLibre v5.x

- Globe projection
- MLT (MapLibre Tiles)
- GeoJSON performance overhaul (~7× faster)
- Terrain & 3D / hillshade methods

**Martin v1.0** — Rust tile server under the MapLibre org; PostGIS, **PMTiles**, MBTiles, COG; MLT support

**MapLibre Flutter v0.3.0** — cross-platform Android/iOS/web support

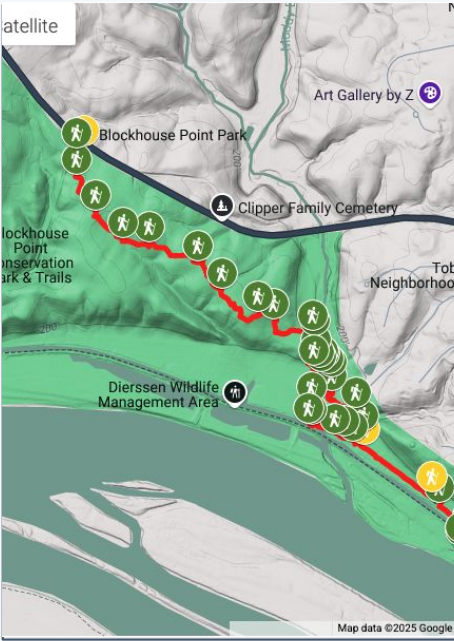

# Solutions At Every Scale

## 1. Locator Map

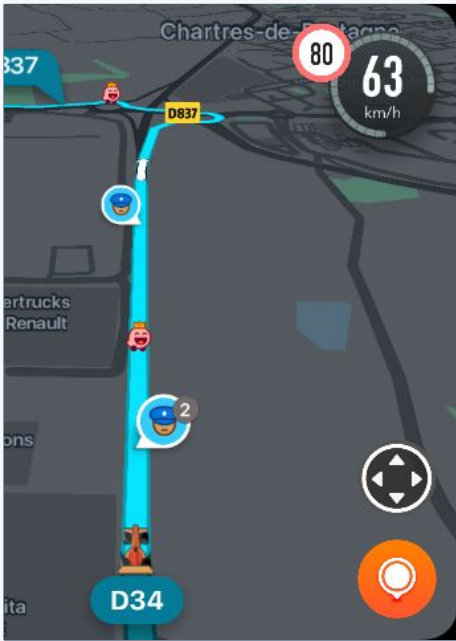

## 2. Trail Map

## 3. Asset Map

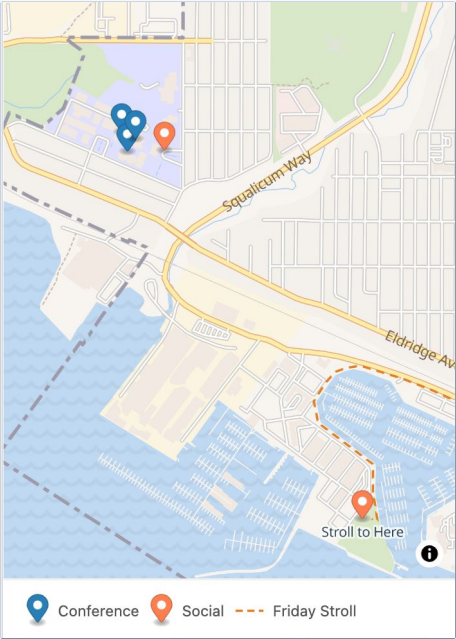

## 4. Map Application

# Solutions At Every Scale

## 1. Locator Map

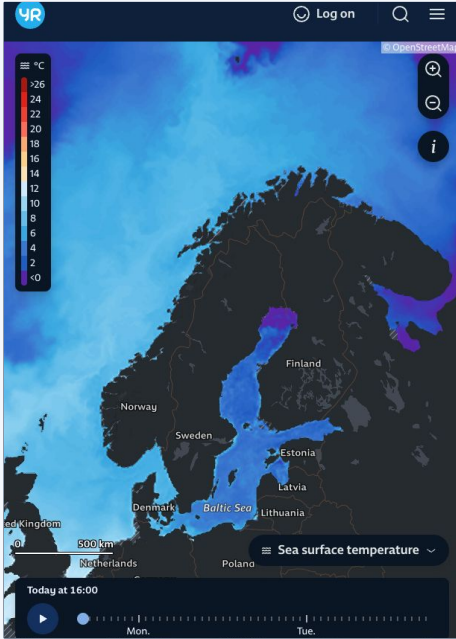

## 2. Trail Map

## 3. Asset Map

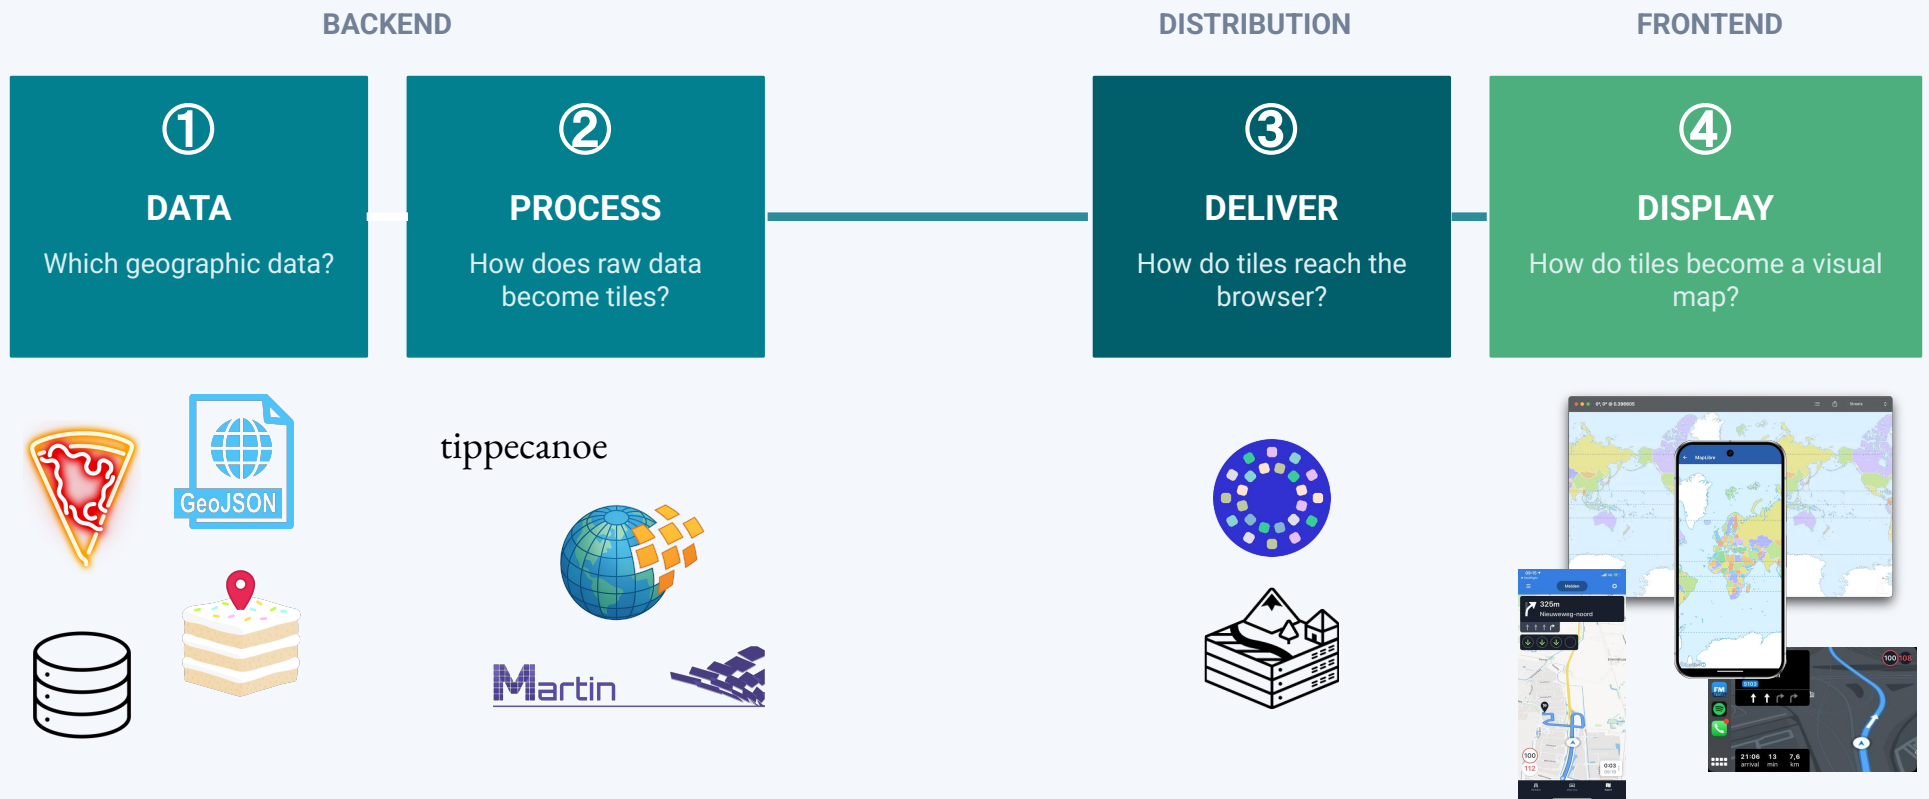

## 4. Map Application

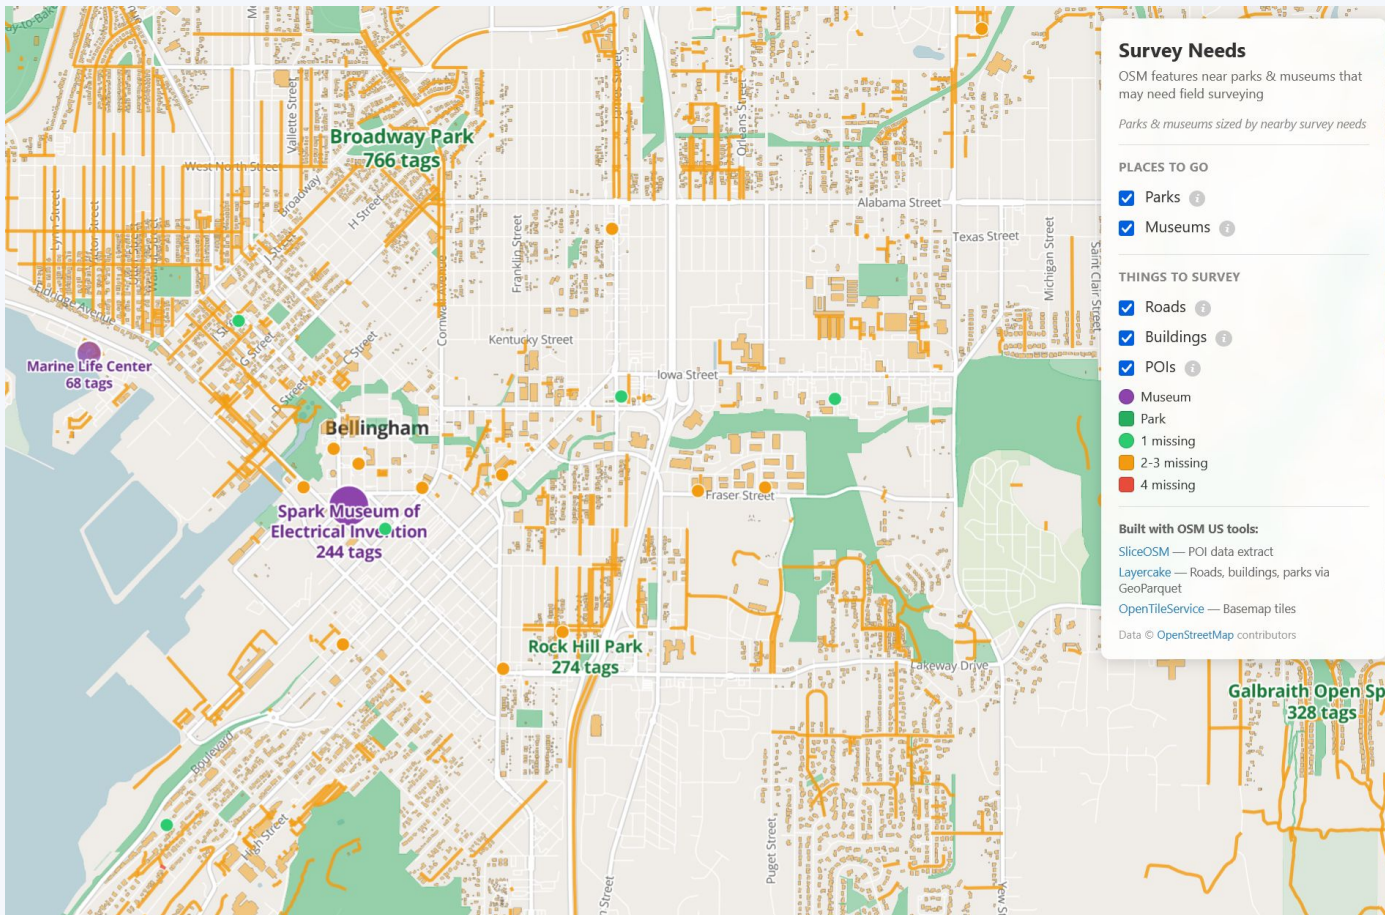

# How a Web Map Works: Three Tiers, Four Decisions

A web map has the same architecture as a web application. If you've ever deployed a web app behind a CDN, you already understand the fundamentals:

# Custom map of Bellingham (for surveying!)

## Data Requirements

- Basemap
- Parks
- Museums
- Roadways
- Buildings

# ① Data

## Which geographic data?

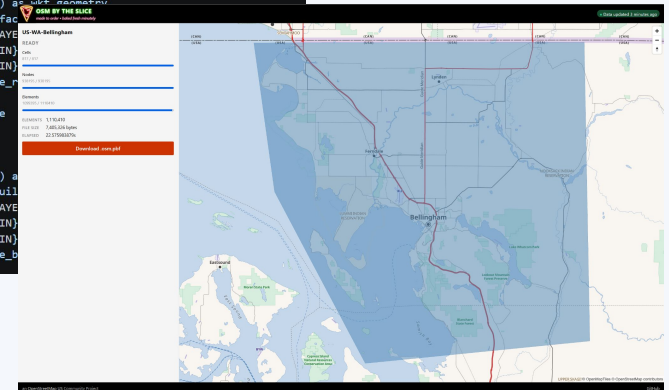

What data do you need? · How much reference data from OSM? · How fresh is that data?

	Freshness	Data span
Geofabrik	daily updates	premade regions
Overpass	minutely	sparse features
SliceOSM	minutely	custom region
Layercake	weekly	thematic layers

```
25 INSTALL spatial; LOAD spatial;
26 INSTALL httpfs; LOAD httpfs;
27
28 -- Parks from Layercake
29 COPY (
30   SELECT
31     id, type,
32     ST_AsText(geometry) as wkt_geometry,
33     name
34   FROM read_parquet('${LAYERCAKE_BASE}/parks.parquet')
35   WHERE bbox.xmin > ${XMIN} AND bbox.xmax < ${XMAX}
36         AND bbox.ymin > ${YMIN} AND bbox.ymax < ${YMAX}
37 ) TO '${DATA_DIR}/layercake_parks.tsv' (HEADER, DELIMITER ' ');
38
39 -- Highways from Layercake
40 COPY (
41   SELECT
42     id, type,
43     ST_AsText(geometry) as wkt_geometry,
44     name, highway, surface
45   FROM read_parquet('${LAYERCAKE_BASE}/highways.parquet')
46   WHERE bbox.xmin > ${XMIN} AND bbox.xmax < ${XMAX}
47         AND bbox.ymin > ${YMIN} AND bbox.ymax < ${YMAX}
48 ) TO '${DATA_DIR}/layercake_highways.tsv' (HEADER, DELIMITER ' ');
49
50 -- Buildings from Layercake
51 COPY (
52   SELECT
53     id, type,
54     ST_AsText(geometry) as wkt_geometry,
55     name, building, "building:part" as part
56   FROM read_parquet('${LAYERCAKE_BASE}/buildings.parquet')
57   WHERE bbox.xmin > ${XMIN} AND bbox.xmax < ${XMAX}
58         AND bbox.ymin > ${YMIN} AND bbox.ymax < ${YMAX}
59 ) TO '${DATA_DIR}/layercake_buildings.tsv' (HEADER, DELIMITER ' ');
60
```

## ② Process

### How does raw geographic data become tiles?

②

#### ⚡ You can skip this decision entirely IF:

Use pre-built tiles from OSM US Tile Service, or extract PMTiles from Protomaps and host it yourself. Layer in your own data on top as GeoJSON or PMTiles.

#### Static (like a static site generator)

OSM PBF → Planetiler/tippecanoe → PMTiles or MBTiles → host anywhere

(Planetiler generates a full global basemap in hours on one machine. !!!)

*Best for reference maps, infrequent updates*

#### Dynamic (like an application server)

OSM PBF → osm2pgsql (imports into PostGIS) → Martin, Tilekiln, or Beefsteak

Martin: general-purpose Rust tile server; PostGIS, PMTiles, COG – v1.3 production-stable  
Tilekiln: purpose-built for Shortbread from PostGIS – what OSMF runs on osm.org (July 2025)  
Beefsteak: tiles pulled as fresh as possible from OSM

*Best for live data, custom schemas, mixed layers*

## ③ Deliver

### How do tiles reach the browser?

Lots of options for vector tiles. They just have to be hosted *somewhere* and then everything is possible. The spectrum of choices here barely existed a few years ago.

Option	Best for	What you manage
<b>OSM US TileService (or OpenFreeMap)</b>	Getting started, community projects	Nothing
<b>Protomaps or PMTiles on S3 / R2 / GitHub Pages*</b>	Full control, static data, low cost	Object storage + maybe CDN
<b>Martin behind a CDN</b>	Dynamic data at scale	Server + database

\*You can “productionize” a static PMTiles deployment by adding in CloudFlare Workers or AWS Lambda with CDN support, lowers latency and is very economical

## ④ Display

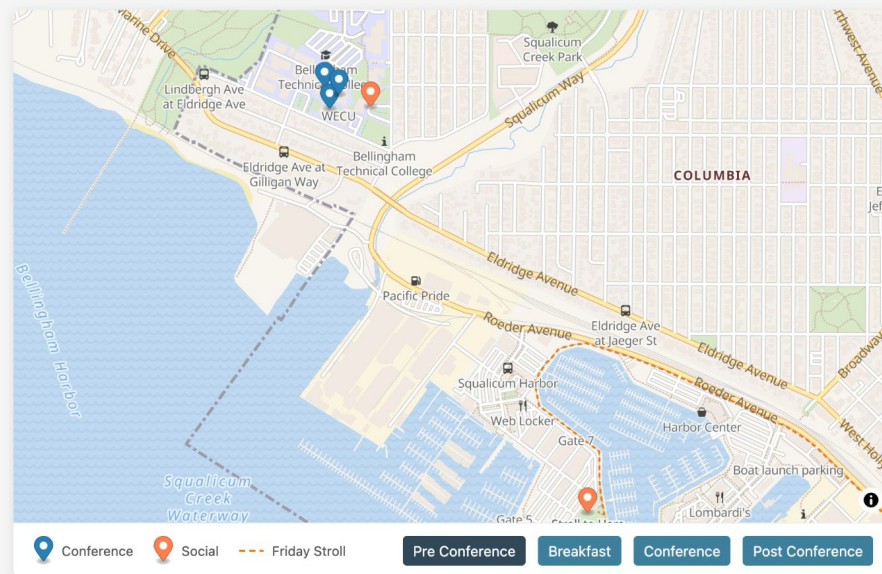

### How do tiles become a visual map?

It's all about the *style*

- Must conform to the **MapLibre Style Spec**
- Base or reference styles are **tile schema specific**
- **Add in your own layers**, based on the tile schema, OR add new data sources
- **Interleave style layers** from different sources, not just on top!

LFNW 2026 Conference Map

# Putting It All Together

## BACKEND

### ① DATA

OpenStreetMap  
Geofabrik · SliceOSM  
Layercake  
Overpass API

### ② PROCESS

Planetiler (+ schema)  
osm2pgsql → Tilekiln / Martin

## DISTRIBUTION

### ③ DELIVER

OSM US Tileservice  
Protomaps CDN  
PMTiles on S3/R2  
GitHub Pages  
Martin + CDN

## FRONTEND

### ④ DISPLAY

MapLibre GL JS  
MapLibre Native  
Style Specification  
(+ GeoJSON layers)  
Open fonts + sprites

#### Four entry points — pick where you start:

**Fastest:** Skip ① and ②. Point MapLibre at the OSM US Tileservice.

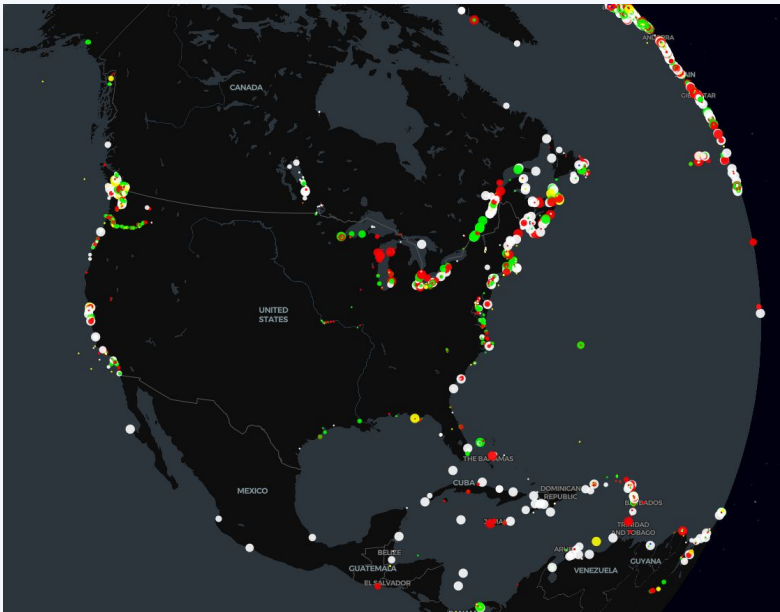

**More control:** Protomaps basemap → GitHub Pages or S3 → style in MapLibre.

**Full (static):** Layercake/SliceOSM → Planetiler → PMTiles on CDN → MapLibre.

**Full (dynamic):** Shortbread/Beafsteak → Martin → MapLibre.
